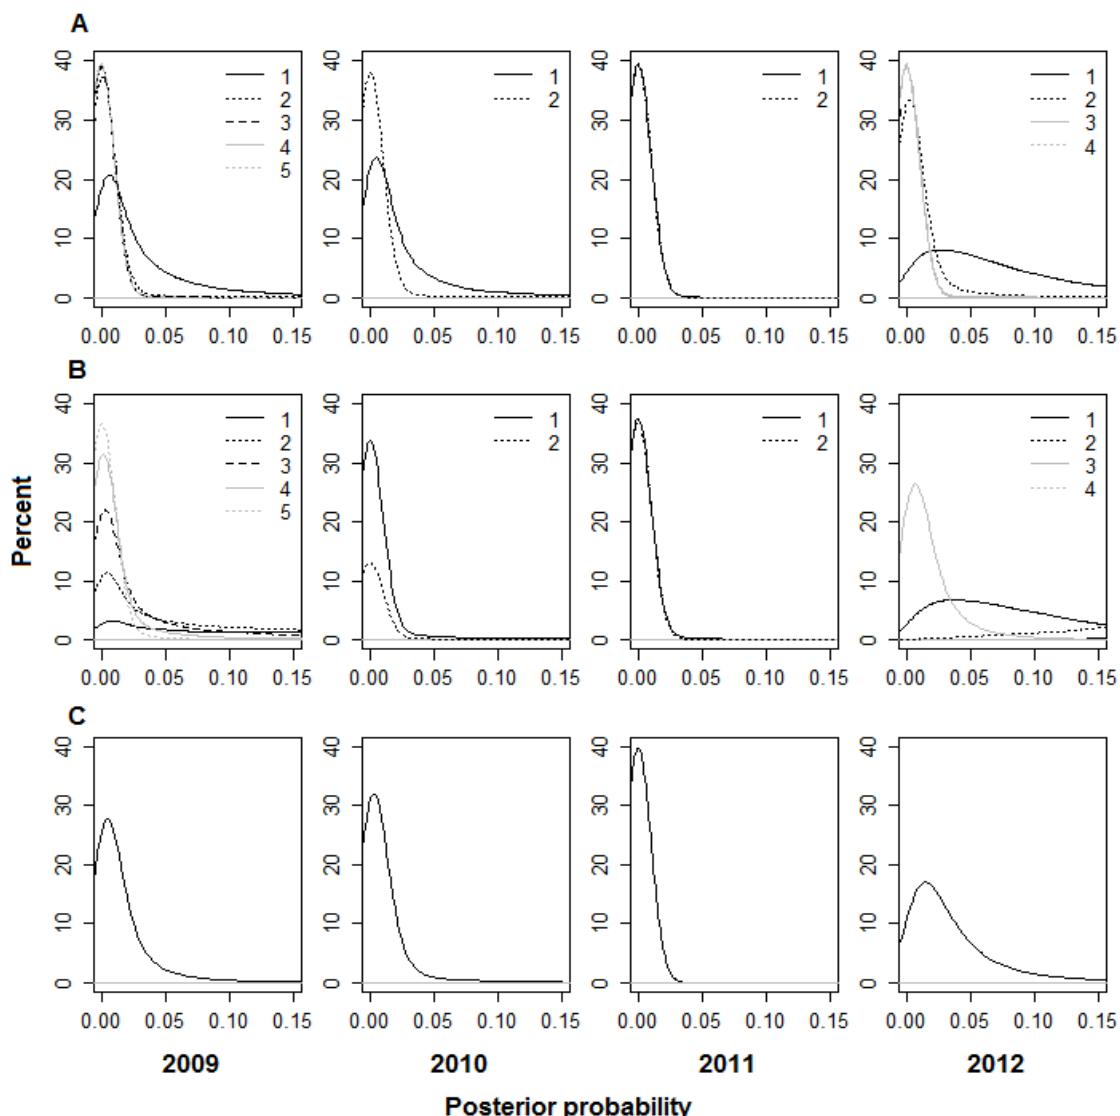

Figure S1. Density plots of the posterior probability of green turtle detections at acoustic stations deployed in Dry Tortugas National Park from 2009-2012 with 13 acoustically tagged turtles by the daily model (A) and the seasonal model (B) and the estimated conditional probability of multiple turtle detections in a day at a station given at least one turtle detection (C). Numbers in the legend (1–5) indicate the number of detected turtles in a day (A) or season (B).

Table S1. Posterior summary (mean, SD, median, and 95% credible interval as indicated by 2.5% and 97.5% of the samples) of parameters for the models of daily and seasonal detection probability at stations, estimated by detections at acoustic receivers deployed in Dry Tortugas National Park from 2009 to 2013 with 13 tagged turtles.

Year	Daily detection model					Seasonal detection model					
	Parameter	Mean	SD	2.50%	Median	97.50%	Mean	SD	2.50%	Median	97.50%
