Supplement. Detailed allocations to regional and sub-regional stocks in mixed-stock analysis

Table S1. *Oncorhynchus tshawytscha*. Unweighted mean (SE) estimated stock composition (%) by region and season averaged between 1998–2008, for 15 regional and 40 sub-regional stocks of juvenile Chinook salmon. Stocks were allocated according to Beacham et al. (2006 a,b). Briefly, ten 20 000-iteration Markov chain Monte Carlos were run using an uninformative prior with a value of 0.90 for a randomly picked population (Pella & Masuda 2001). Estimated stock compositions were considered to have converged when the shrink factor was <1.2 for the 10 chains (Pella & Masuda 2001). The posterior distributions from the last 1000 iterations for all chains were combined to estimate mean stock composition and SE. Run-timings: Spring (Sp), Summer,(Su), Fall (F). Regions: E/WCVI = east/west coast Vancouver Island; CC: central British Columbia (BC); SEAK: southeast Alaska, QSI: Queen Charlotte Islands. Annual stock compositions are available on request
