

Supplement

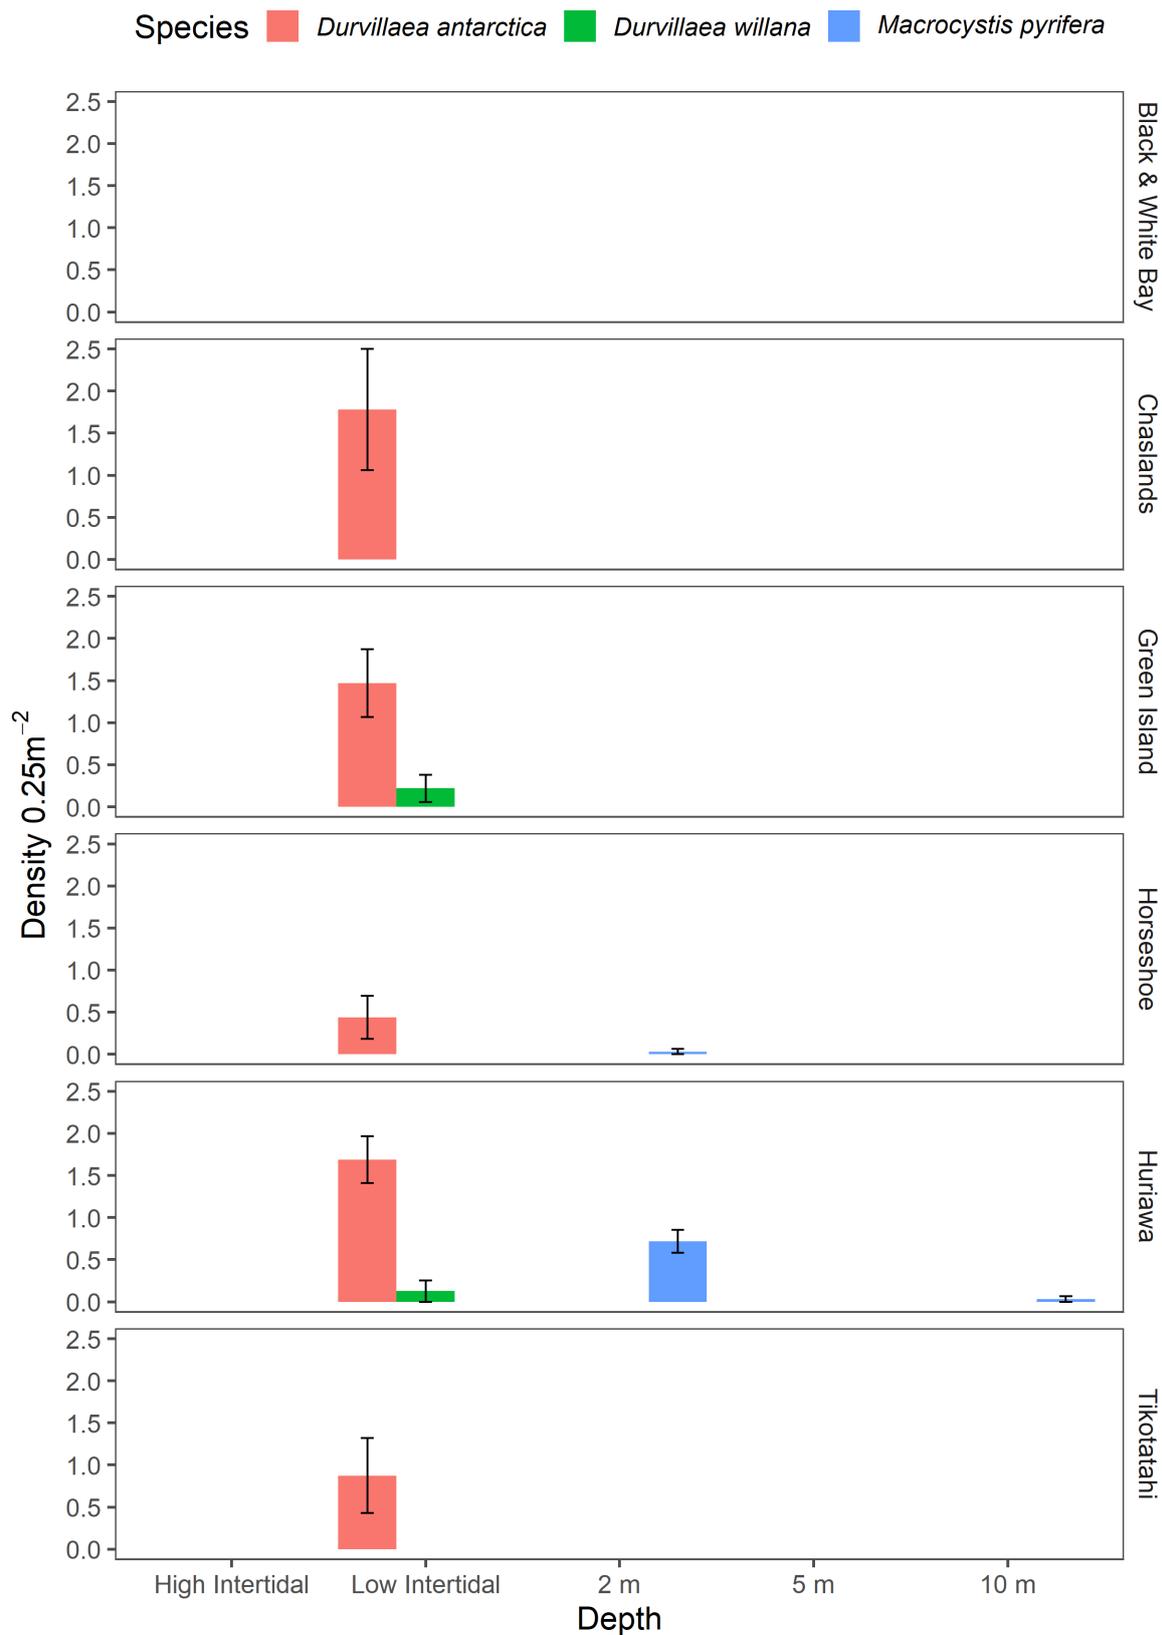

Figure S1: The density of three species of macroalgae obtained from an additional eight 1m<sup>2</sup> quadrats completed alongside 0.25m<sup>2</sup> harvested quadrats. The species shown represent those where adult thalli were not harvested for biomass estimates in the 0.25m<sup>2</sup> quadrats. Note, that juvenile thalli of these species were still harvested. None of the 3 species were found in the additional surveys at Black and White Bay.

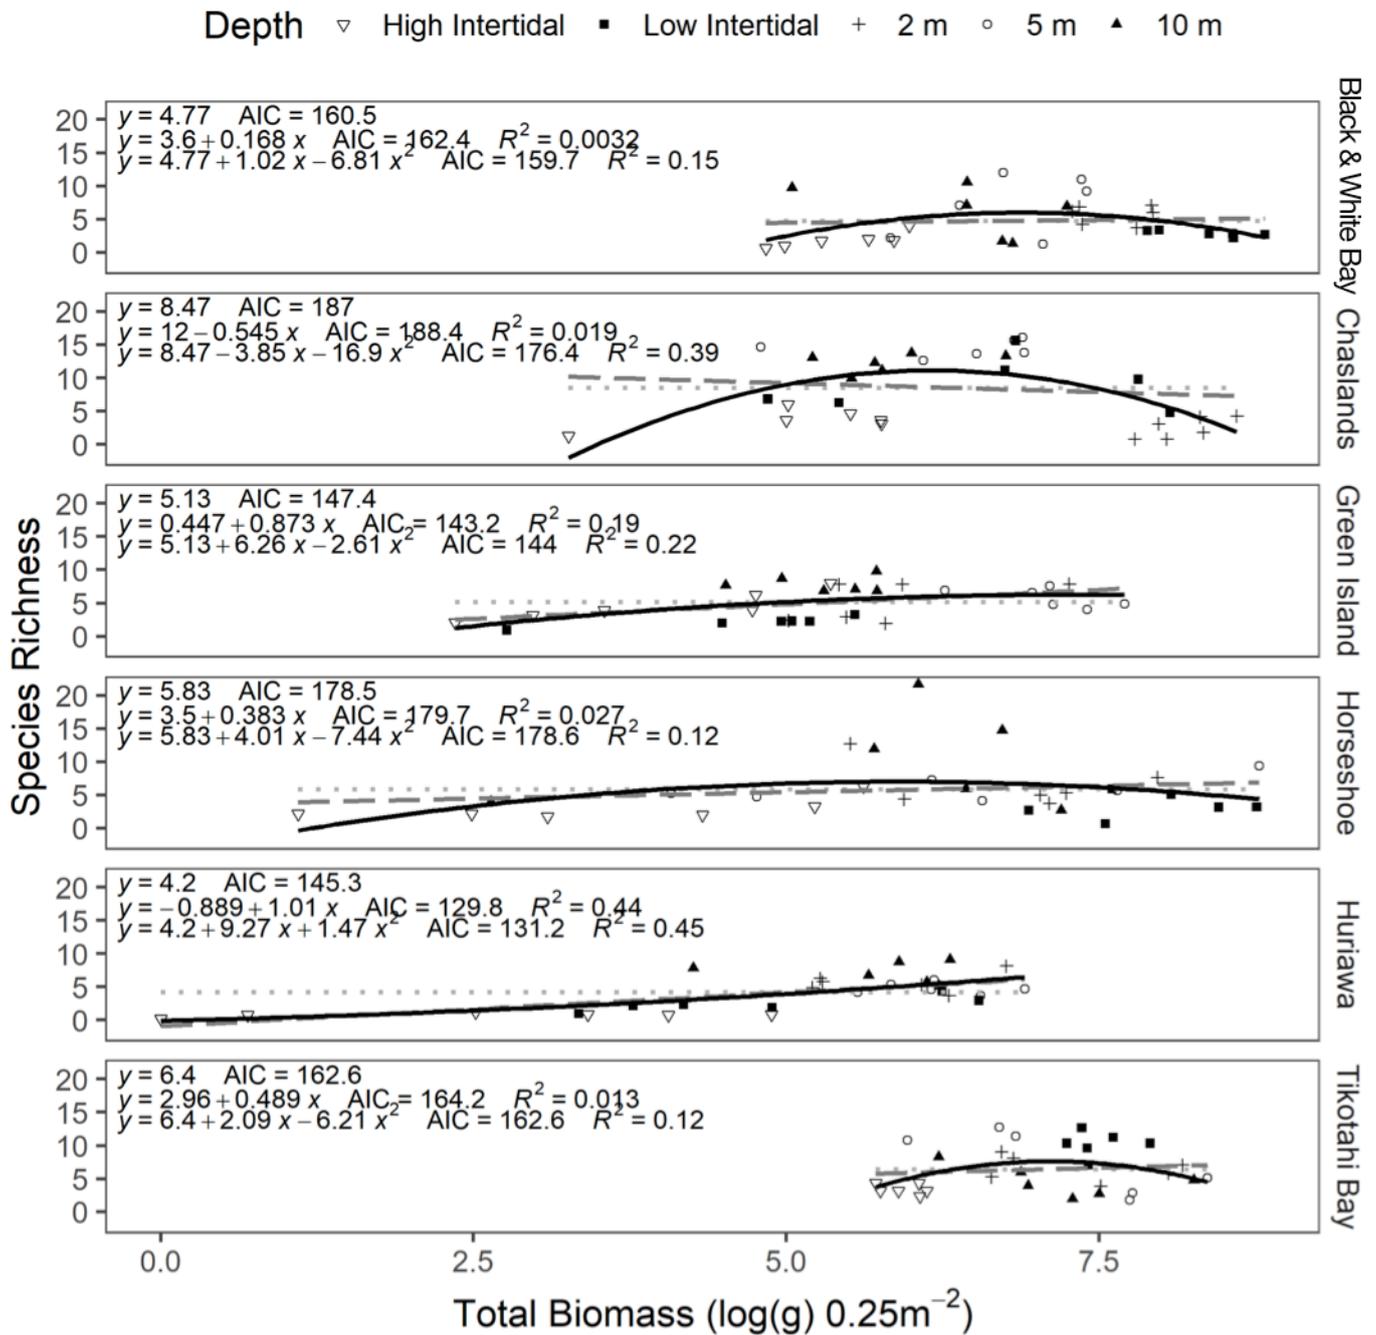

Figure S2: The relationship between species richness (number of species) and total biomass shown on a log scale from the high intertidal down to ten metres depth across six rocky reef systems in southern New Zealand. The dotted light grey line is the null model (richness = intercept), the dashed grey line the linear model (richness = intercept + biomass) and the solid black line is the quadratic model (richness = intercept + biomass + biomass<sup>2</sup>).

Table S1: Species of algae identified from biomass survey on southern New Zealand rocky reefs. Red = phylum Rhodophyta, green = phylum Chlorophyta and brown = phylum Ochrophyta

Species	Taxonomic grouping	Species	Taxonomic grouping

Table S2: Summary table comparing macroalgal A/ biomass (linear mixed model) and B/ species richness (generalised linear mixed regression model with negative binomial family link) across five depth ranges (fixed factor) in southern New Zealand. Site is included as a random factor in both models. High = high intertidal, low = low intertidal, two= two metres below MLW, five = five metres below MLW, and ten= ten metres below MLW. Estimate= parameter estimate, SE= standard error, and p-values <0.05 are in bold.

	Variable	Estimate	SE	t-value	p-value
<b>A/ Biomass</b>					
	Intercept	6.96	0.98	7.14	<b>&lt;0.001</b>
	Low	5.83	0.67	8.70	<b>&lt;0.001</b>
	Two	6.31	0.67	9.41	<b>&lt;0.001</b>
	Five	5.45	0.67	8.12	<b>&lt;0.001</b>
	Ten	3.68	0.67	5.49	<b>&lt;0.001</b>
<b>B/ Species Richness</b>					
	Intercept	1.03	0.14	7.22	<b>&lt;0.001</b>
	Low	0.54	0.15	3.64	<b>&lt;0.001</b>
	Two	0.65	0.15	4.46	<b>&lt;0.001</b>
	Five	0.97	0.14	6.94	<b>&lt;0.001</b>
	Ten	1.05	0.14	7.54	<b>&lt;0.001</b>

Table S3: Results of post-hoc multiple comparisons of A/ Biomass and B/ Species richness for macroalgae across the five depth ranges in southern New Zealand (see Table S2 for model outputs). High = high intertidal, low = low intertidal, two= two metres below MLW, five = five metres below MLW, and ten= ten metres below MLW. Estimate= parameter estimate, SE= standard error, and p-values <0.05 are in bold.

	Comparisons	Estimate	SE	z-value	p-value
<b>A/ Biomass</b>					
	low-high	0.54	0.15	3.64	<b>0.002</b>
	two-high	0.654	0.15	4.45	<b>&lt;0.001</b>

	five-ten	0.13	1.07	1

Table S5: Significant indicator species analysis for algae species from different depth strata across rocky reefs in southern New Zealand. *IndVal* are indicator values, proportion of total biomass is the proportion of the total biomass at the given depth explained by the species. These indicator values range from zero to one, with zero being no preference (or avoidance) for the species towards a particular depth stratum. A value of one represents the species occurring at all sites within a particular depth stratum and absent from all other depth strata at all remaining sites.

Species	IndVal	p-value	Proportion of total biomass
<b>High Intertidal</b>			
<i>Bostrychia arbuscula</i>	1	0.001	0.31
<i>Apophlaea lyallii</i>	0.816	0.001	0.41
<b>Low Intertidal</b>			
<i>Codium dimorphum</i>	0.881	0.001	0.04
<i>Xiphophora gladiata</i>	0.859	0.003	0.76
Articulated coralline algae	0.761	0.005	0.03
<i>Durvillaea antarctica</i> (juveniles)	0.707	0.018	0.08
<b>Two metres</b>			
<i>Marginariella boryana</i>	0.841	0.017	0.4
<i>Dictyota kunthii</i>	0.698	0.025	<0.01
<b>Five + Ten metres</b>			
<i>Craspedocarpus erosus</i>	0.859	0.002	<0.01
<i>Plocamium</i> spp.	0.85	0.004	0.01
<i>Caulerpa brownii</i>	0.814	0.01	0.14
<i>Carpomitra costata</i>	0.764	0.007	<0.01
<i>Ecklonia radiata</i>	0.764	0.012	0.14
<i>Euptilota formosissima</i>	0.758	0.01	<0.01
<i>Cladhymenia oblongifolia</i>	0.707	0.019	<0.01
<i>Adamsiella chauvinii</i>	0.645	0.05	<0.01
<i>Rhodophyllis membranacea</i>	0.645	0.037	<0.01

Table S6: The percentage cover of sessile invertebrates (all species combined) and the density of large mobile grazing invertebrates at each of the five depth strata identified from an additional eight 1m<sup>2</sup> quadrats completed alongside 0.25m<sup>2</sup> harvested quadrats.

Depth	Sessile (%)	Mobile (0.25m <sup>-2</sup> )		
	Invertebrates ± SE	<i>Evechinus chloroticus</i> ± SE	<i>Haliotis</i> spp. ± SE	<i>Scutus breviculus</i> ± SE
<b>High</b>	2.3 ± 0.5	0.005 ± 0.005	0	0
<b>Low</b>	0.2 ± 0.1	0	0	0
<b>Two</b>	9.6 ± 2.5	0.01 ± 0.007	0.005 ± 0.005	0
<b>Five</b>	17.8 ± 3.8	0.011 ± 0.007	0	0
<b>Ten</b>	14.0 ± 2.4	0.005 ± 0.005	0.01 ± 0.01	0.01 ± 0.007
