

**TABLES**

Table S1. Model selection for the detection ( $p$ ) of Common Eider non-parenting adults. Number of parameters ( $K$ ), Akaike Information Criterion adjusted for sample size and over-dispersion ( $\text{QAIC}_c$ ;  $\hat{c} = 1.21$ ), difference between model and minimum  $\text{QAIC}_c$  values ( $\Delta\text{QAIC}_c$ ), and model weight ( $w_i$ ) are shown. Models with  $\Delta\text{QAIC}_c < 2$  are shown, as well as the intercept only model. \* = selected detection model that will be used in the parameterization of  $\psi$ .

Table S20. Model selection for the occupancy ( $\psi$ ) of divers. Number of parameters ( $K$ ), Akaike Information Criterion adjusted for sample size and over-dispersion ( $\text{QAIC}_c$ ;  $\hat{\epsilon} = 1.05$ ), difference between model and minimum  $\text{QAIC}_c$  values ( $\Delta\text{QAIC}_c$ ), and model weight ( $w_i$ ) are shown. Models with  $\Delta\text{QAIC}_c < 2$  are shown, as well as the intercept only model.

Guild	Model	$K$	$\text{QAIC}_c$	$\Delta\text{QAIC}_c$	$w_i$
<b>Divers</b>					
	$p(.) \psi(A. nodosum + F. vesiculosus + \text{other macroalgae})$	6	222.955	0.000	0.229
	$p(.) \psi(A. nodosum + F. vesiculosus)$	5	224.609	1.655	0.100
	$p(.) \psi(.)$	3	232.342	9.387	0.002

Table S21. Parameter estimates for the occupancy ( $\psi$ ) of scavengers. Parameter estimates, standard errors (SE), and lower and upper 85% confidence intervals (LCL and UCL, respectively) are shown. Models with  $\Delta\text{QAIC}_c < 2$  are shown, as well as the intercept only model.

<b>Guild</b>	<b>Model</b>	<b>85% CI</b>

## FIGURES

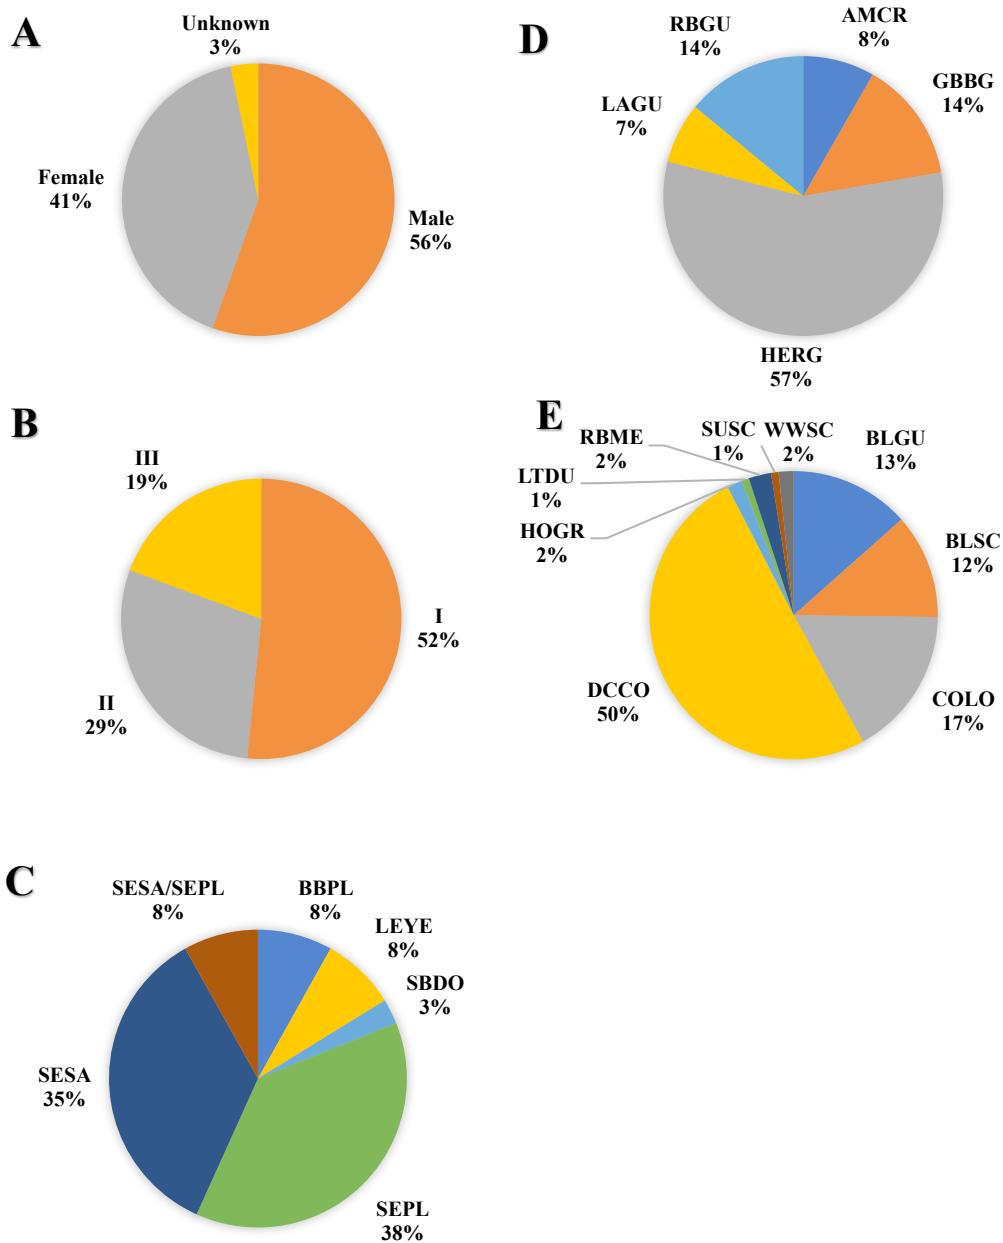

Figure S1. (A) Sex composition of Common Eider non-parenting adults; (B) age composition of Common Eider broods; and species composition of (C) shorebird, (D) scavenger, and (E) diver guilds. Percentages represent the relative contribution of each sex/age/species toward the total number of occurrences. For Common Eider broods, age class I = downy young, age class II = partly feathered young, and age class III = fully feathered young that remain in this class until capable of flight (Gallop and Marshall 1954). For guilds, the alpha codes are as follows: BBPL = Black-bellied Plover, LEYE = Lesser Yellowlegs, SBDO = Short-billed Dowitcher, SEPL = Semipalmated Plover, SESA = Semipalmated Sandpiper, AMCR = American Crow, GBBG = Great Black-backed Gull, HERG = Herring Gull, LAGU = Laughing Gull, RBGU = Ring-billed Gull, BLGU = Black Guillemot, BLSC = Black Scoter, COLO = Common Loon, DCCO = Double-crested Cormorant, HOGR = Horned Grebe, LTDU = Long-tailed Duck, RBME = Red-breasted Merganser, SUSC = Surf Scoter, WWSC = White-winged Scoter.

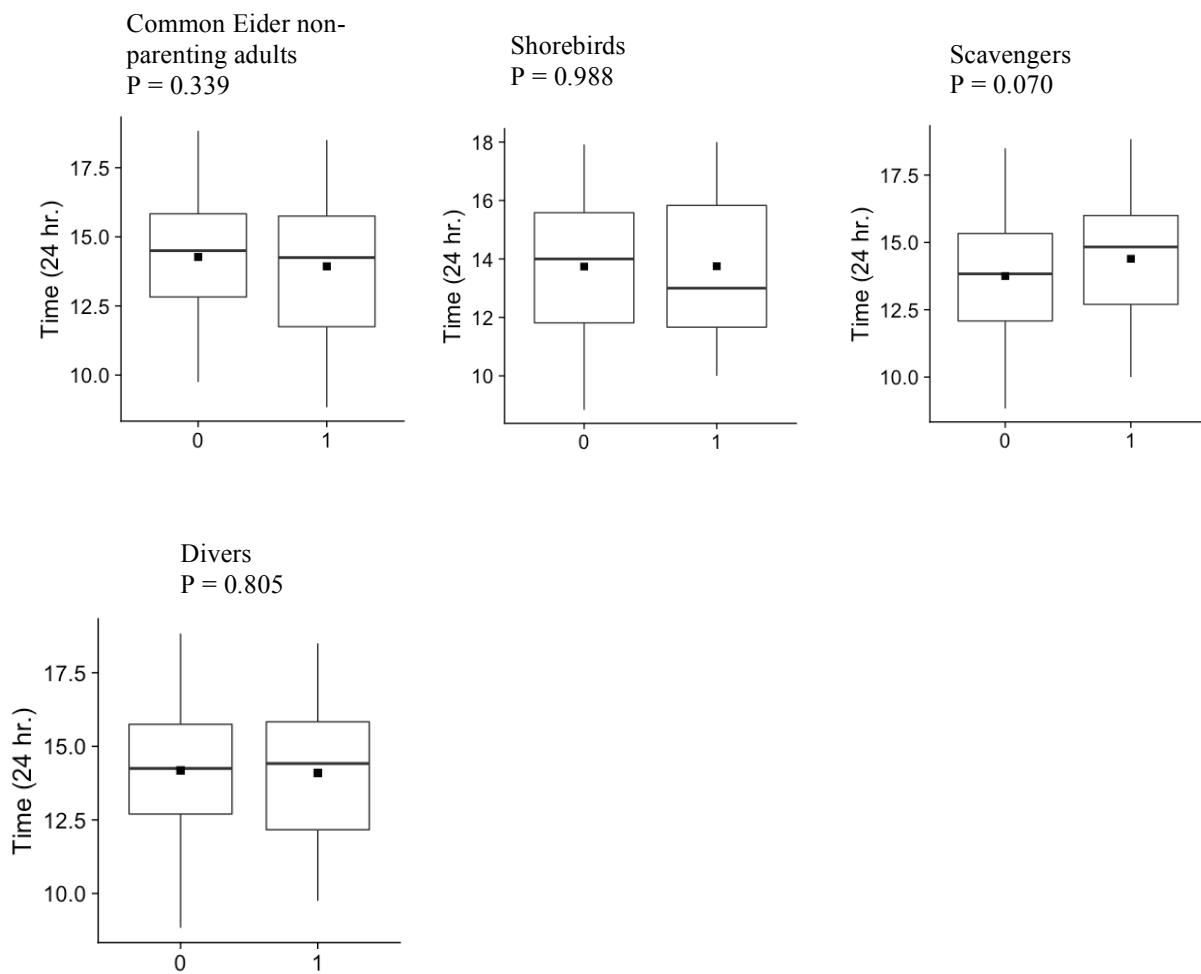

Figure S2. Boxplots showing the distribution of bird survey start times for guild absence (0) and presence (1). Horizontal bars represent the median survey time and black squares represent the mean survey time. There was no significant difference among pairwise relationships for any guild, and as a result we did not include a time-of-day covariate in analyses.
