

Table S1: Average stable nitrogen ( $\delta^{15}\text{N}$ ) and carbon ( $\delta^{13}\text{C}$ ) isotope values and C:N ratios (including standard deviation [SD]) of macroalgal taxa, also including benthic diatoms and particulate organic matter (POM), at each site. N = number of replicates measured at each site.

Site	Taxonomic group	Taxon	Sample type	$\delta^{15}\text{N} \pm SD$	$\delta^{13}\text{C} \pm SD$	C:N $\pm SD$	N

Table S3: P-values and adjusted R<sup>2</sup> values of regressions between the chemically-extracted and the mathematically corrected δ<sup>13</sup>C values of benthic Antarctic invertebrates. Mathematical extraction was performed according to Alexander et al. 1996 (see text for details). N is the number of paired δ<sup>13</sup>C values per taxon.
