

Supplement 1

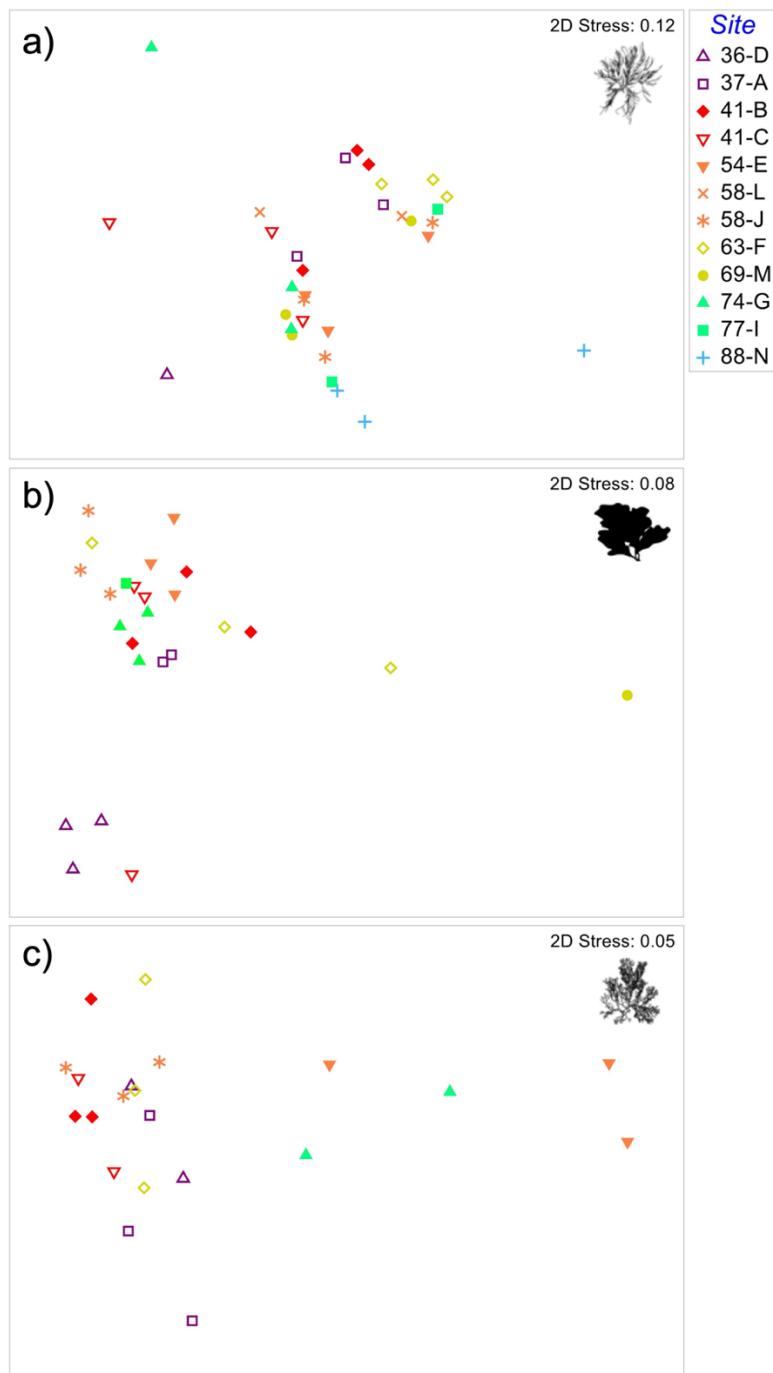

Fig. S1. NMDS visualizations of the fatty acid signatures (50 fatty acids, proportional data) of the two seaweeds, color-coded according to the sites and ice cover gradient: a) *Desmarestia menziesii*; b) *Iridaea cordata*; c) *Plocamium* sp.. Ice cover (NIC annual %) was not a significant explanatory variable (DISTLM tests) in the multivariate fatty acids of these taxa (see **Table 2**, **Table S3**).

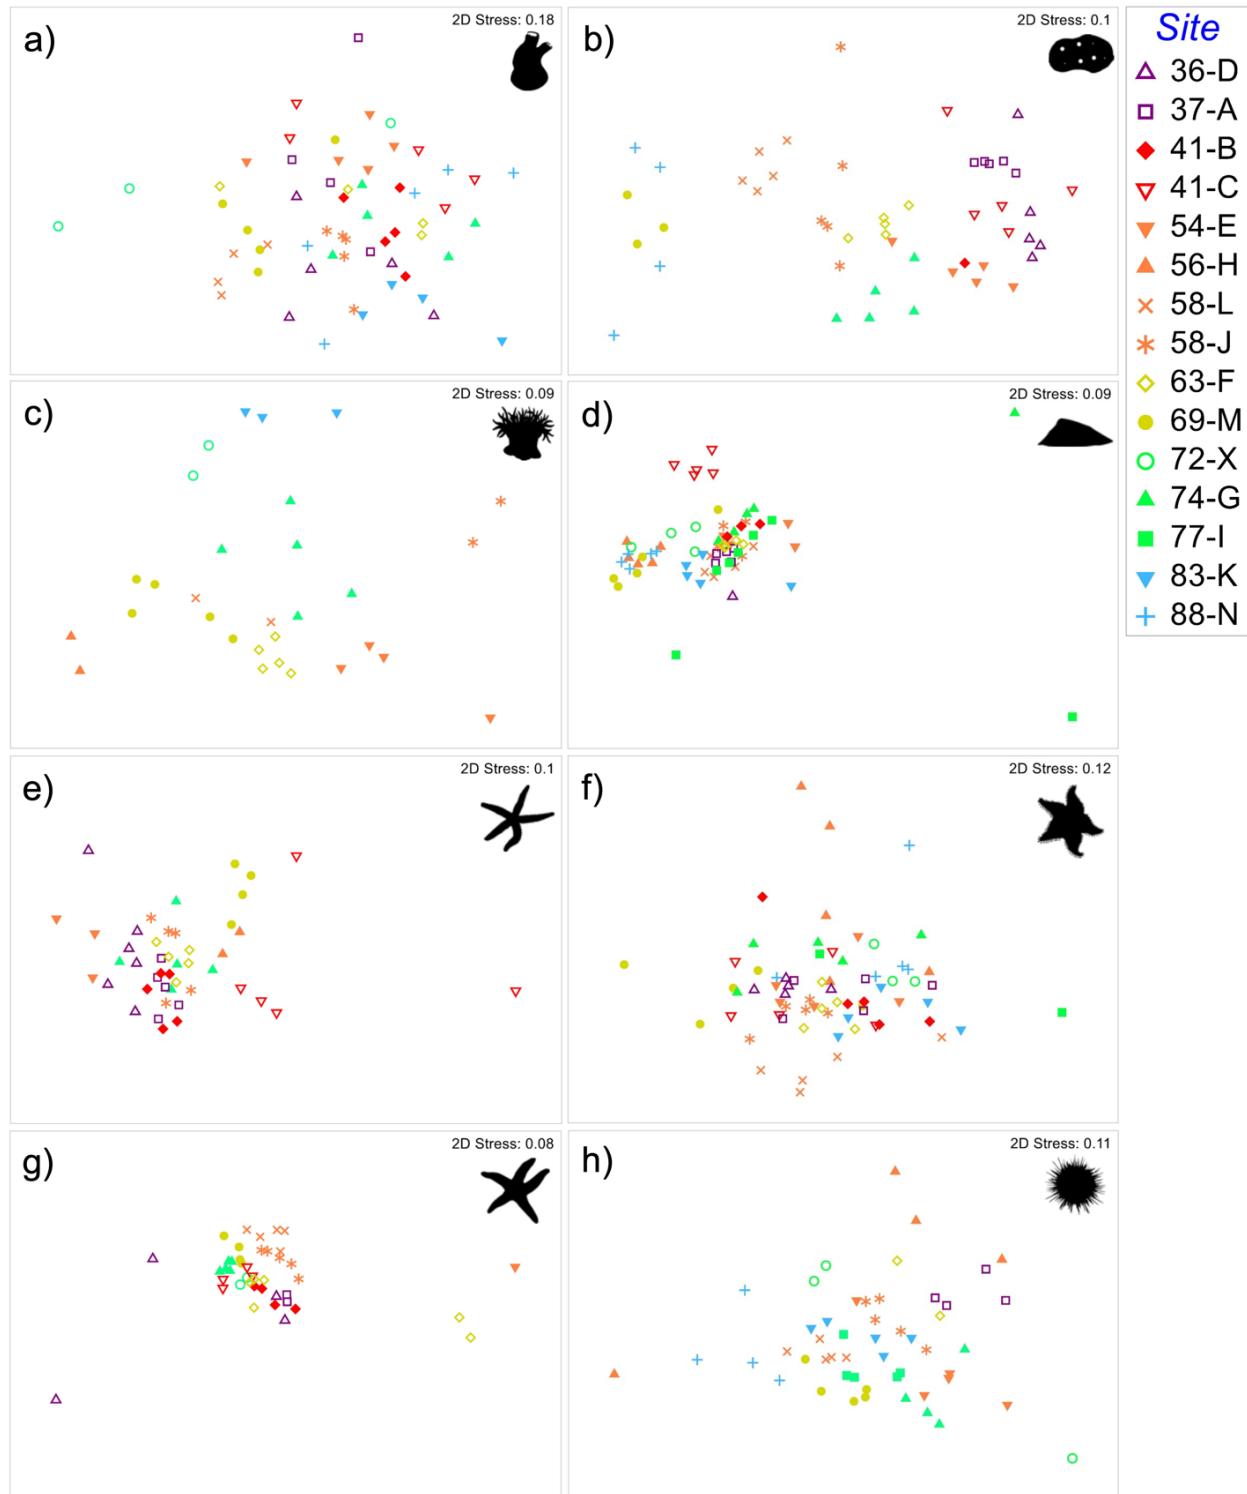

Fig S2. NMDS visualizations of the fatty acid signatures (50 fatty acids, proportional data) of a) *Cnemidocarpa* sp.; b) *Dendrilla antarctica*; c) *Isotealia antarctica*; d) *Nacella concinna*; e) *Neosmilaster georgianus*; f) *Odontaster validus*; g) *Perknaster aurorae*; and h) *Sterechinus neumayeri*. Ice cover (NIC annual %) was a significant explanatory variable for the multivariate fatty acid compositions in five of these consumers (a, b, c, f, h) (see **Table 2**, **Table S3**).

Table S1. Full table of PERMANOVA results on the factor ‘site’.

taxon	df	SS	MS	Pseudo-F	Unique perms	p(MC)
